Dear Editor,

We read the letter¹ with great interest, thank you for your comments.

As the authors mentioned in their letter¹ a smartphone-based application can be very useful for daily practice. We think that the main problem in these applications is the difficulty related to language. For example, encephalapp stroop test is in English and you can not change the language of the application. We think also grasping a pen is not the same as using a smartphone screen. For some patients, it is very difficult to use a small phone screen.

We appreciate the authors' comment and we thank them again for their interest in our article.²

Declaration of Interests: The authors have no conflict of interest to declare.
